

RADIOFREQUENCY SKIN TIGHTENING

About

Radio frequency skin tightening is an aesthetic technique that uses RF energy to heat tissue and stimulate subdermal collagen production in order to reduce the appearance of fine lines and loose skin. The skin and subcutaneous layer are heated simultaneously forcing collagen fibers to contract. The contracting fibers pull and tighten the skin. Skin metabolism increases, producing new collagen fibers. Most of the RF energy enters into the deeper dermal layer, causing the dermal layer of skin to thicken, decreasing wrinkle depth, and leaving the skin firmer with a lifted contour.

Treatment

There are immediate visible results, however; your new collagen will begin to form approximately 10 days after your treatment and continue for up to 6 months! Each treatment session is approximately an hour, with no down time after.
